

COMMENCEMENT OF DRILLING HAGENHOF COPPER PROJECT, NAMIBIA

~3,000 metre Diamond and RC drilling program underway

Highlights

- Tanga has commenced approximately 3,000 metres of Diamond and RC drilling at Hagenhof
- The drill program is designed to test copper and cobalt mineralisation at several targets, including:
 - Diamond drilling at Main Gossan with several holes to test a prominent magnetic feature (where historical diamond drilling was reported to have intersected copper-cobalt mineralisation)
 - RC drilling to test a prominent circular magnetic anomaly coinciding with a large interpreted structural domal feature at Liv's Hill
 - Outcropping copper mineralisation at Jette's Hill and Copper Cap
 - New zone of copper mineralisation identified at P5, located 4km south of Main Gossan
- Tanga currently holds a total ground position on the Damara Belt, Namibia of over 1,700km²

Tanga Resources Ltd (ASX: TRL) ("Tanga" or the "Company") is pleased to announce that drilling has commenced at the Company's Hagenhof Copper Project ("Hagenhof" or the "Project"), in Namibia.

The planned program is now a total of approximately 3,000 metres of Diamond and Reverse Circulation (RC) drilling and will test copper mineralisation at several targets at Hagenhof. The revision to the previously announced RC drill program is due to an unexpected delay in the arrival of the RC rig from South Africa. The drilling contractor has provided a track mounted diamond drill rig, at no additional cost to the Company, until the RC drill rig arrives. The program will then revert back to RC drilling.

Diamond drilling has commenced at the Main Gossan targeting a prominent ground magnetic anomaly and will test the strike, plunge and grade of the historically reported copper mineralisation. It is expected that RC drilling will then test the prominent magnetic anomaly coinciding with a large interpreted structural domal feature at Liv's Hill, before going on to test copper mineralisation at Jette's Hill, Copper Cap and P5; all of which have never previously been drilled.

Drill core and chips from the drilling program will be transported to the Intertek Laboratory at Tschudi for sample preparation and then sent to Maddington, WA for assay. The Company will provide further information on the drilling to the market at the first opportunity.

About Tanga Resources

Tanga Resources (ASX: TRL) is an exploration and development company listed on the Australian Securities Exchange, pursuing a growth strategy focused on highly sought after metals such as gold, copper, cobalt and zinc within its exploration licenses in Namibia.

Competent Person Statement

The information in this report that relates to the exploration results, geology and geophysical interpretation was based on material compiled by John Stockley. Mr Stockley is a Member of the Australian Institute of Geoscientists and is a Director of Tanga Resources Limited. Mr Stockley has sufficient experience relevant to the style of mineralisation and type of deposit under consideration and to the activity which was being undertaken to qualify as Competent Person as defined in the 2012 Edition of the JORC "Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves" (the JORC Code). Mr Stockley consents to the inclusion in this report of the matters based on his information in the form and content in which it appears and confirms that the information in this report is an accurate representation of the available data and studies for the project.

Previously Reported Results

There is information in this report relating to exploration results which were previously announced on 15 August 2018, 16 October 2018, 15 April 2019 and 28 May 2019. Other than as disclosed in those announcements, the Company confirms that it is not aware of any new information or data that materially affects the information included in the original market announcements.
